INTERPRETATION

** Finding **

The combination of low total protein, low albumin, increased alpha-2 globulins and gamma globulins may suggest the chronic inflammatory state and combined presence of the nephrotic syndrome.

** Opinion **

1. Chronic inflammatory state is suspected.
2. Combined Nephrotic pattern
3. There is no evidence of paraprotein.

** Recommendation **

Consider the clinical situation and 24hr urine total protein, urine PEP.
